

What we See and What we Value AI with a human Perspective.

- First Light - 540 million years ago
- Earth is primordial soup.
 - Geologically short period of time (milli years)
 - Explosion of animal species
 - Cambrian Explosion
 - Big Bang of evolution

There are many theories explaining, like - climate change, chemical composition of water.

One of the leading theories by Andrew Parker - Australian zoologist. Speciation explosion, conjectured sudden evolution of vision.

A

Where have we come from And Where are we heading to?

3 major thesis

- Building AI to see what humans see
- Building AI to see what humans don't see
- Building AI to see what humans want to see

humans effortless accurate and fast
at seeing objects & object categorization
happens under 150ms.

→ We have dedicated Neural Correlates in
the brain, areas that specialize in
visual recognition.

→ Object Recognition is a fundamental
building block of visual intelligence -
- a north star

you see the world fundamentally different way.

Vision - to navigate, communicate, to entertain, to socialize,

Computer Vision - 60 years ago July 7, 1956 was estimated as a summer project at MIT.

Vision is effortless to see for human whole world's information is visible.

It's become very thriving field both academically and in industry / economically.

Examples:- Image classification in autonomous driving, Ball-co painting,

- Different lighting or texture
- Different background or occlusion
- Different viewing angles.

There are mathematically infinite ways
to render a 3D to 2D pixels.
- really hard problem.
